STATUS: EXPLORATORY / CONCEPTUAL

Designing the Evolution

A conceptual exploration of **organisational knowledge**, AI-assisted product development, and the systems that connect them.

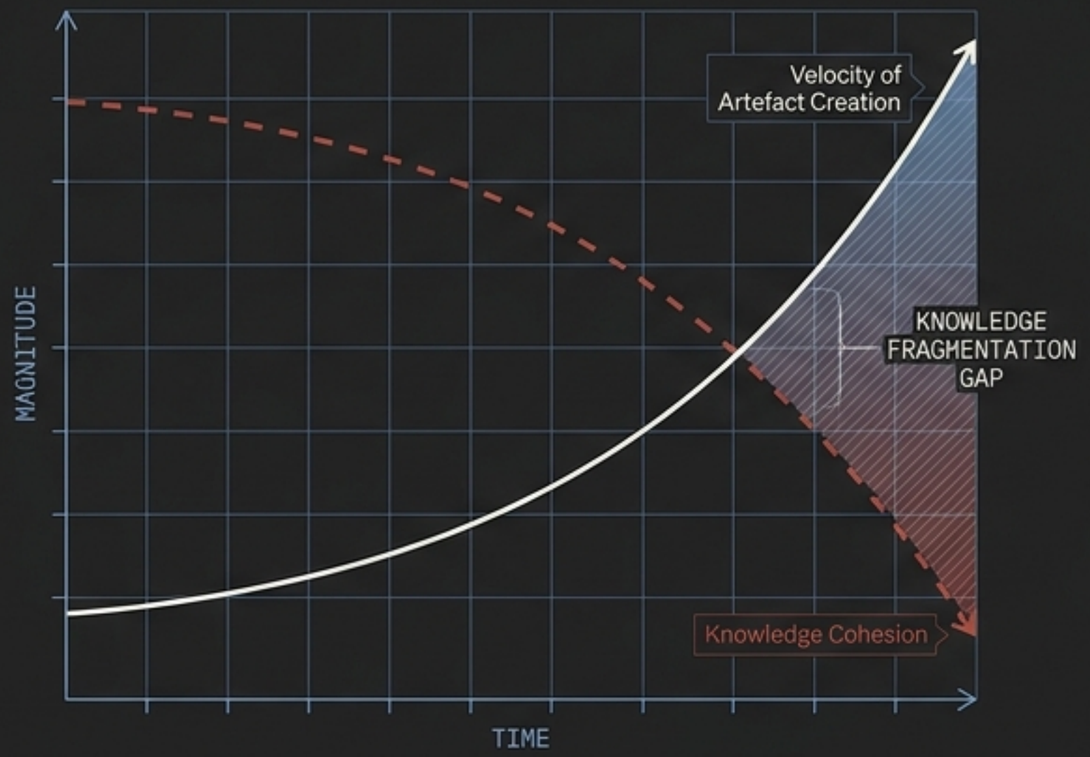

Drafted for conceptual review.

Gemini Notebook

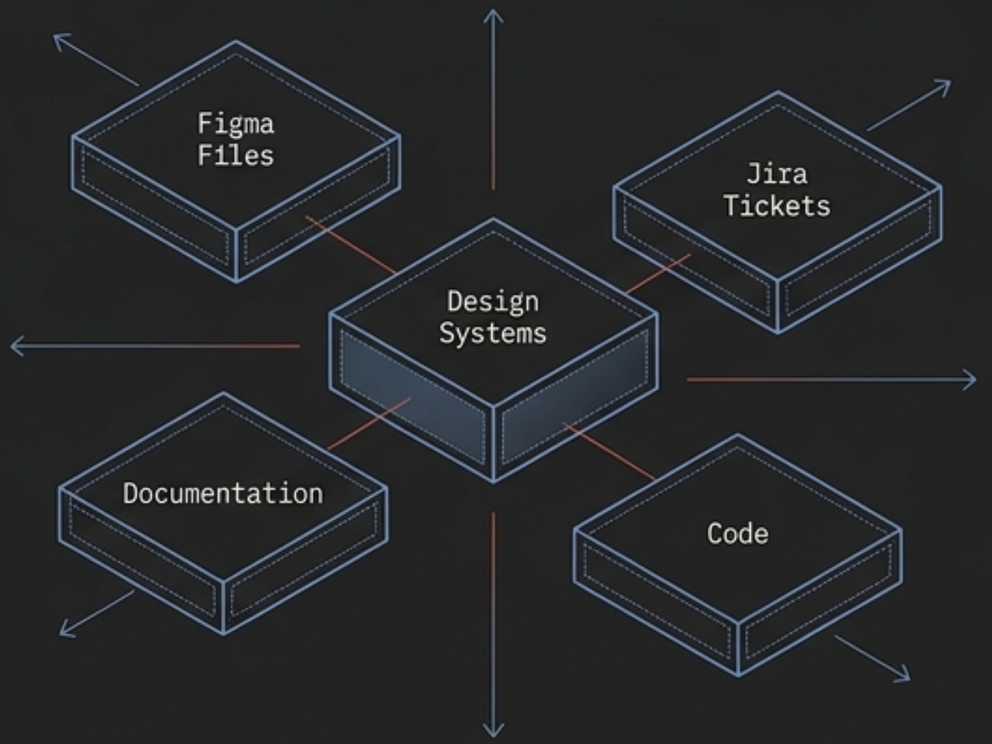

AI accelerates production, but what happens to the knowledge underneath it?

STATUS: EXPLORATORY / CONCEPTUAL

A Current Trajectory

B The Underlying Reality

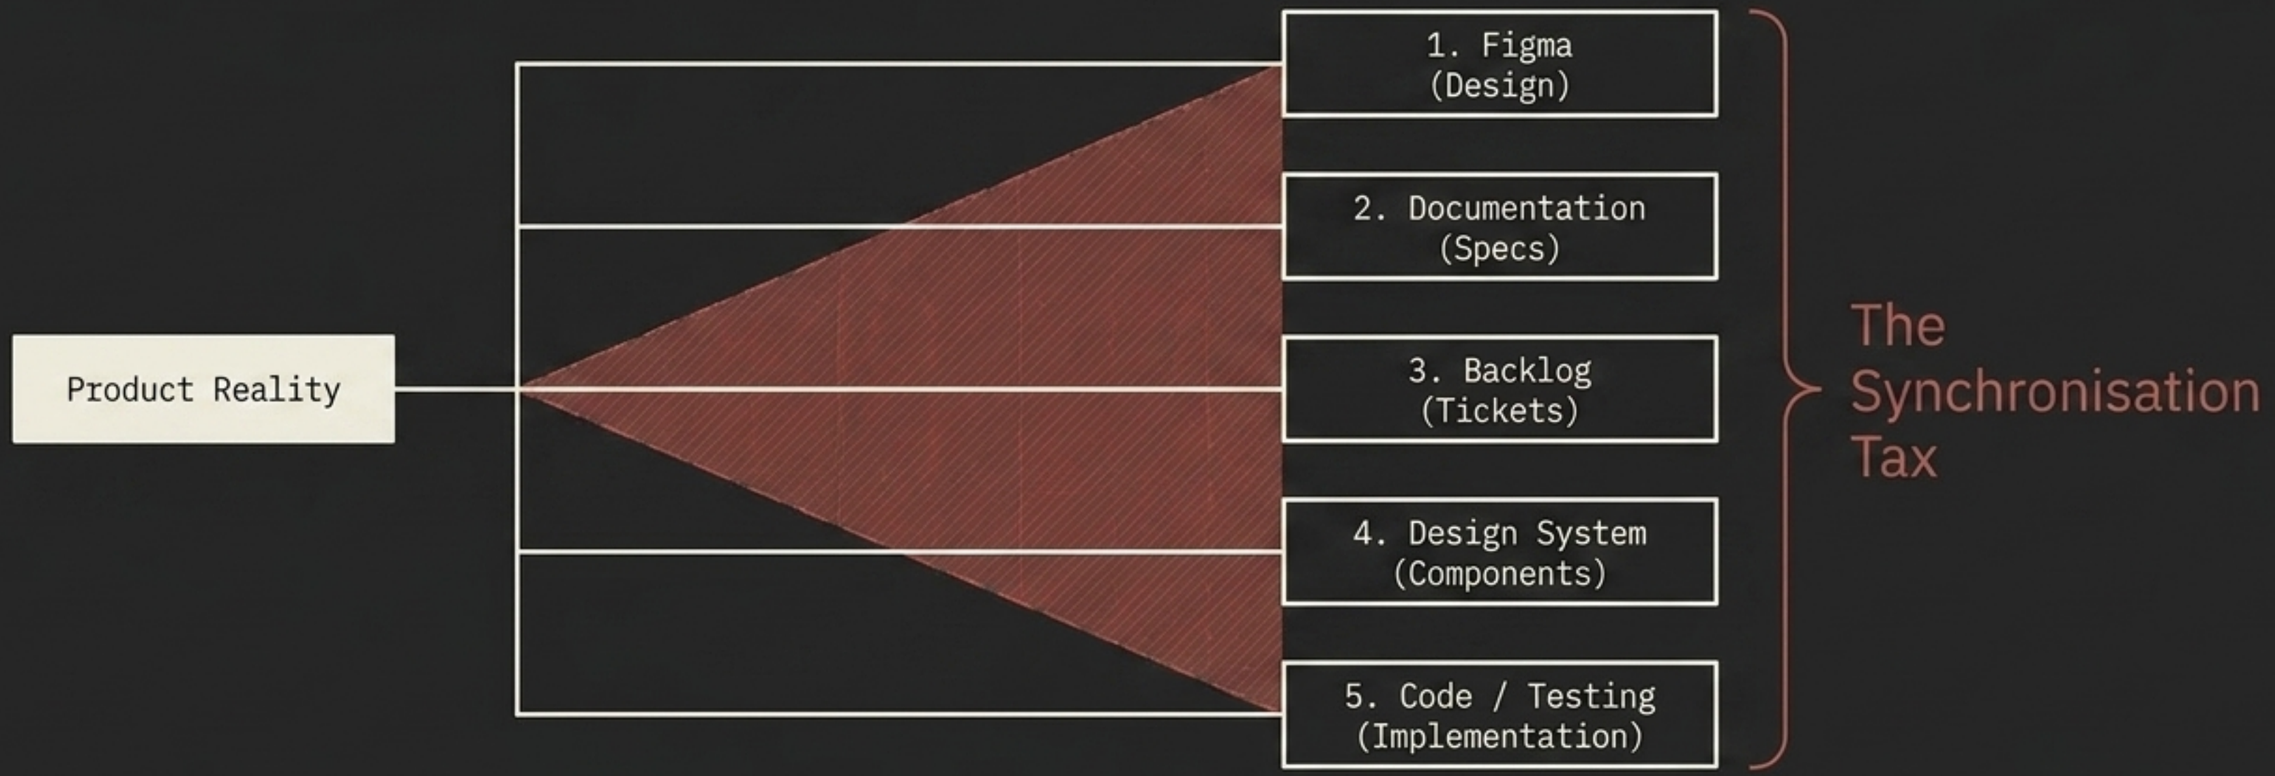

Faster production does not automatically solve the underlying problem of fragmented or inconsistent knowledge. Without structural intervention, AI simply accelerates the speed at which representations drift apart.

Gemini Notebook

The Synchronisation Tax: Divergence in Product Reality

STATUS: EXPLORATORY / CONCEPTUAL

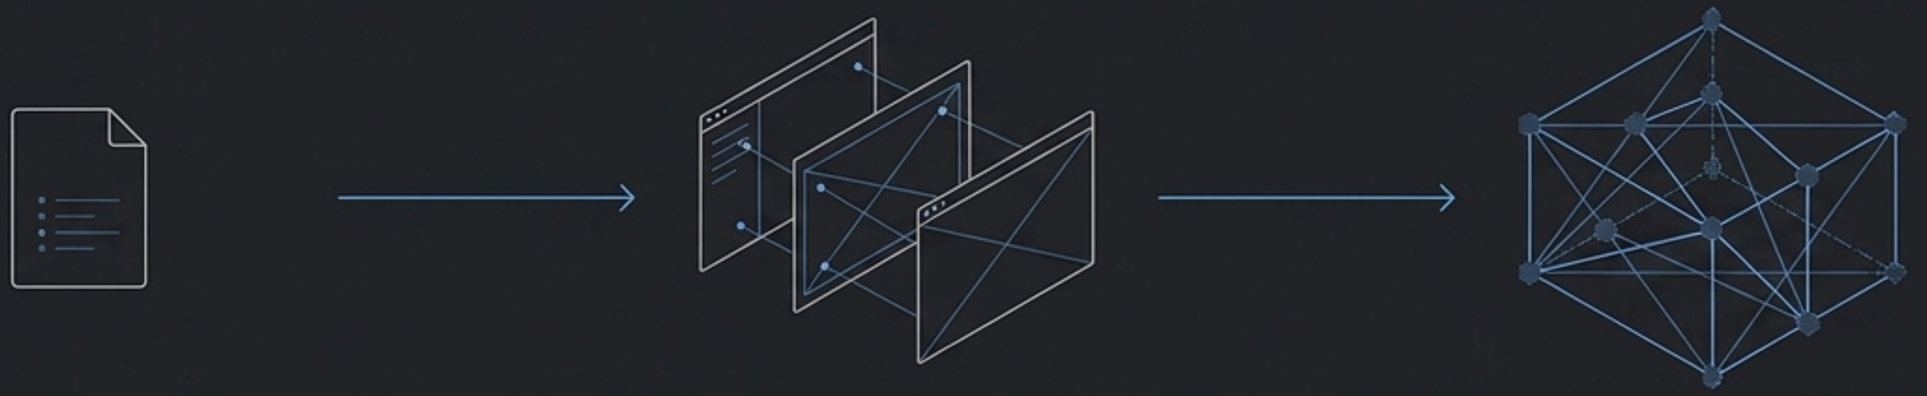

Every divergence between these artifacts creates additional cognitive and operational cost.

Gemini Notebook

STATUS: EXPLORATORY / CONCEPTUAL

Where should the source of truth actually live?

Phase 1: The File

The primary container of design data

Phase 2: The Artefact

Connected representations, but still siloed by discipline

Phase 3: The Knowledge

Structured representation of relationships and rules

Hypothesis: The source of truth is not Figma, code, or a design system. It is a structured representation of the relationships between the underlying knowledge.

Gemini Notebook

STATUS: EXPLORATORY / CONCEPTUAL

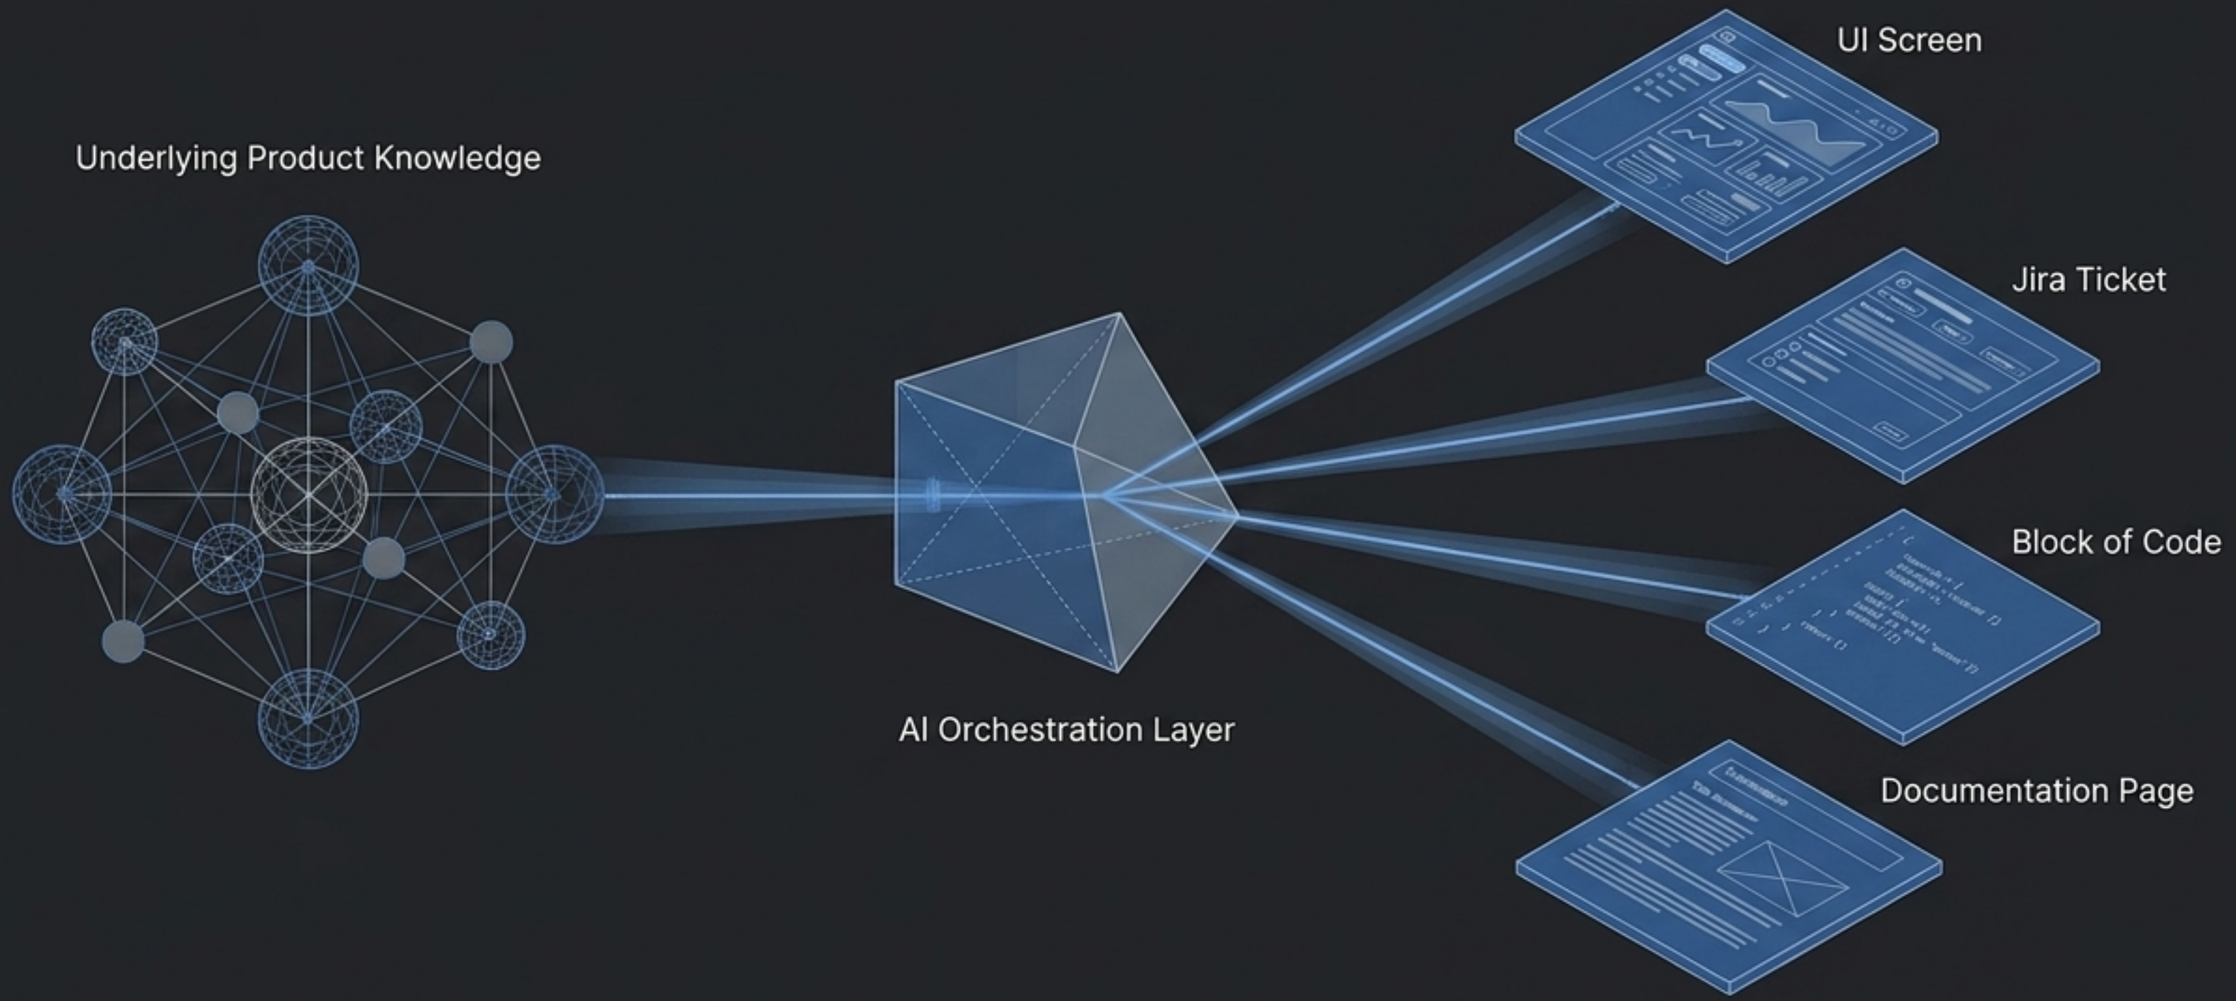

The Proposed Transition: From Files to Knowledge

Enterprise Dimension	The File Era	The Knowledge Era
Primary Source of Truth	The Artefact (Figma, Jira)	The Underlying Data Model
Role of AI	Faster artefact creation	Orchestration and Projection
Risk of Divergence	High / Compounding	Low / Managed
Core Unit of Value	The File	The Relationship

Note: The file remains useful, but it is no longer sufficient as the primary container of product knowledge.

Gemini Notebook

One underlying understanding. Multiple projections.

Knowledge acts as the singular source from which all specialized artefacts are projected, maintained, and validated.

Gemini Notebook

STATUS: EXPLORATORY / CONCEPTUAL

From general-purpose assistants to specialised capabilities

Understand	Decide	Design	Build	Validate	Maintain
Research synthesis Analysis	Strategy Prioritization Product reasoning	UX / UI Interaction Systems	Prototyping Code implementation assistance	Accessibility Critique QA testing	Documentation Consistency Knowledge updates

Terminology like ‘agents’ is merely conceptual shorthand. The real question is how to distribute these distinct responsibilities effectively.

Gemini Notebook

STATUS: EXPLORATORY / CONCEPTUAL

Capability Deployment Diagnostic

	Deterministic Automation	Human Judgement	AI-Assisted Workflow	Autonomous Agents
Token updating	✓			
Strategic alignment		✓		
Pattern generation			✓	
Accessibility validation			✓	✓

Not every problem requires an autonomous agent. Future experimentation must define which responsibilities actually benefit from autonomy versus conventional software.

Gemini Notebook

STATUS: EXPLORATORY / CONCEPTUAL

The Orchestration Loop: Action driven by knowledge

AI can accelerate production, but it does not remove the need for judgement, ethics, accountability, or strategic alignment.

Gemini Notebook

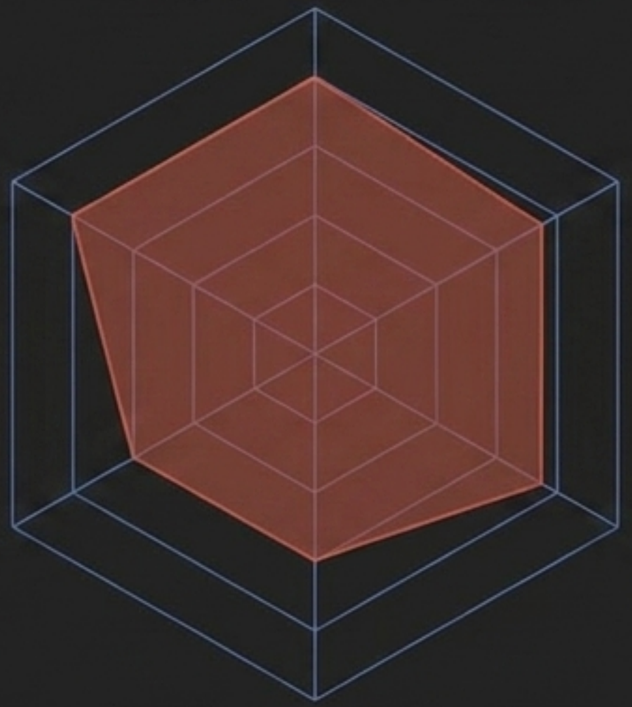

STATUS: EXPLORATORY / CONCEPTUAL

Enterprise Reality: Anticipated Failure Modes

Knowledge Drift
The underlying model becomes stale.

Governance Overhead
When maintenance outpaces value.

False Authority
Assuming structure equals correctness.

Automation without Judgement
Optimizing a fundamentally flawed process.

Conflicting Truths
When research, business, and tech disagree.

Over-agentification
Applying autonomy where simple automation suffices.

Warning: If the underlying organisational knowledge is wrong, AI will simply propagate the mistake faster.

Gemini Notebook

STATUS: EXPLORATORY / CONCEPTUAL

What remains unproven

The Reality Check

No production implementation yet.

Enterprise validity unverified.

ROI unmeasured.

Agent boundaries remain theoretical.

Governance model untested.

Questions to Test

How does an AI system know which knowledge is current?

How are conflicting sources resolved?

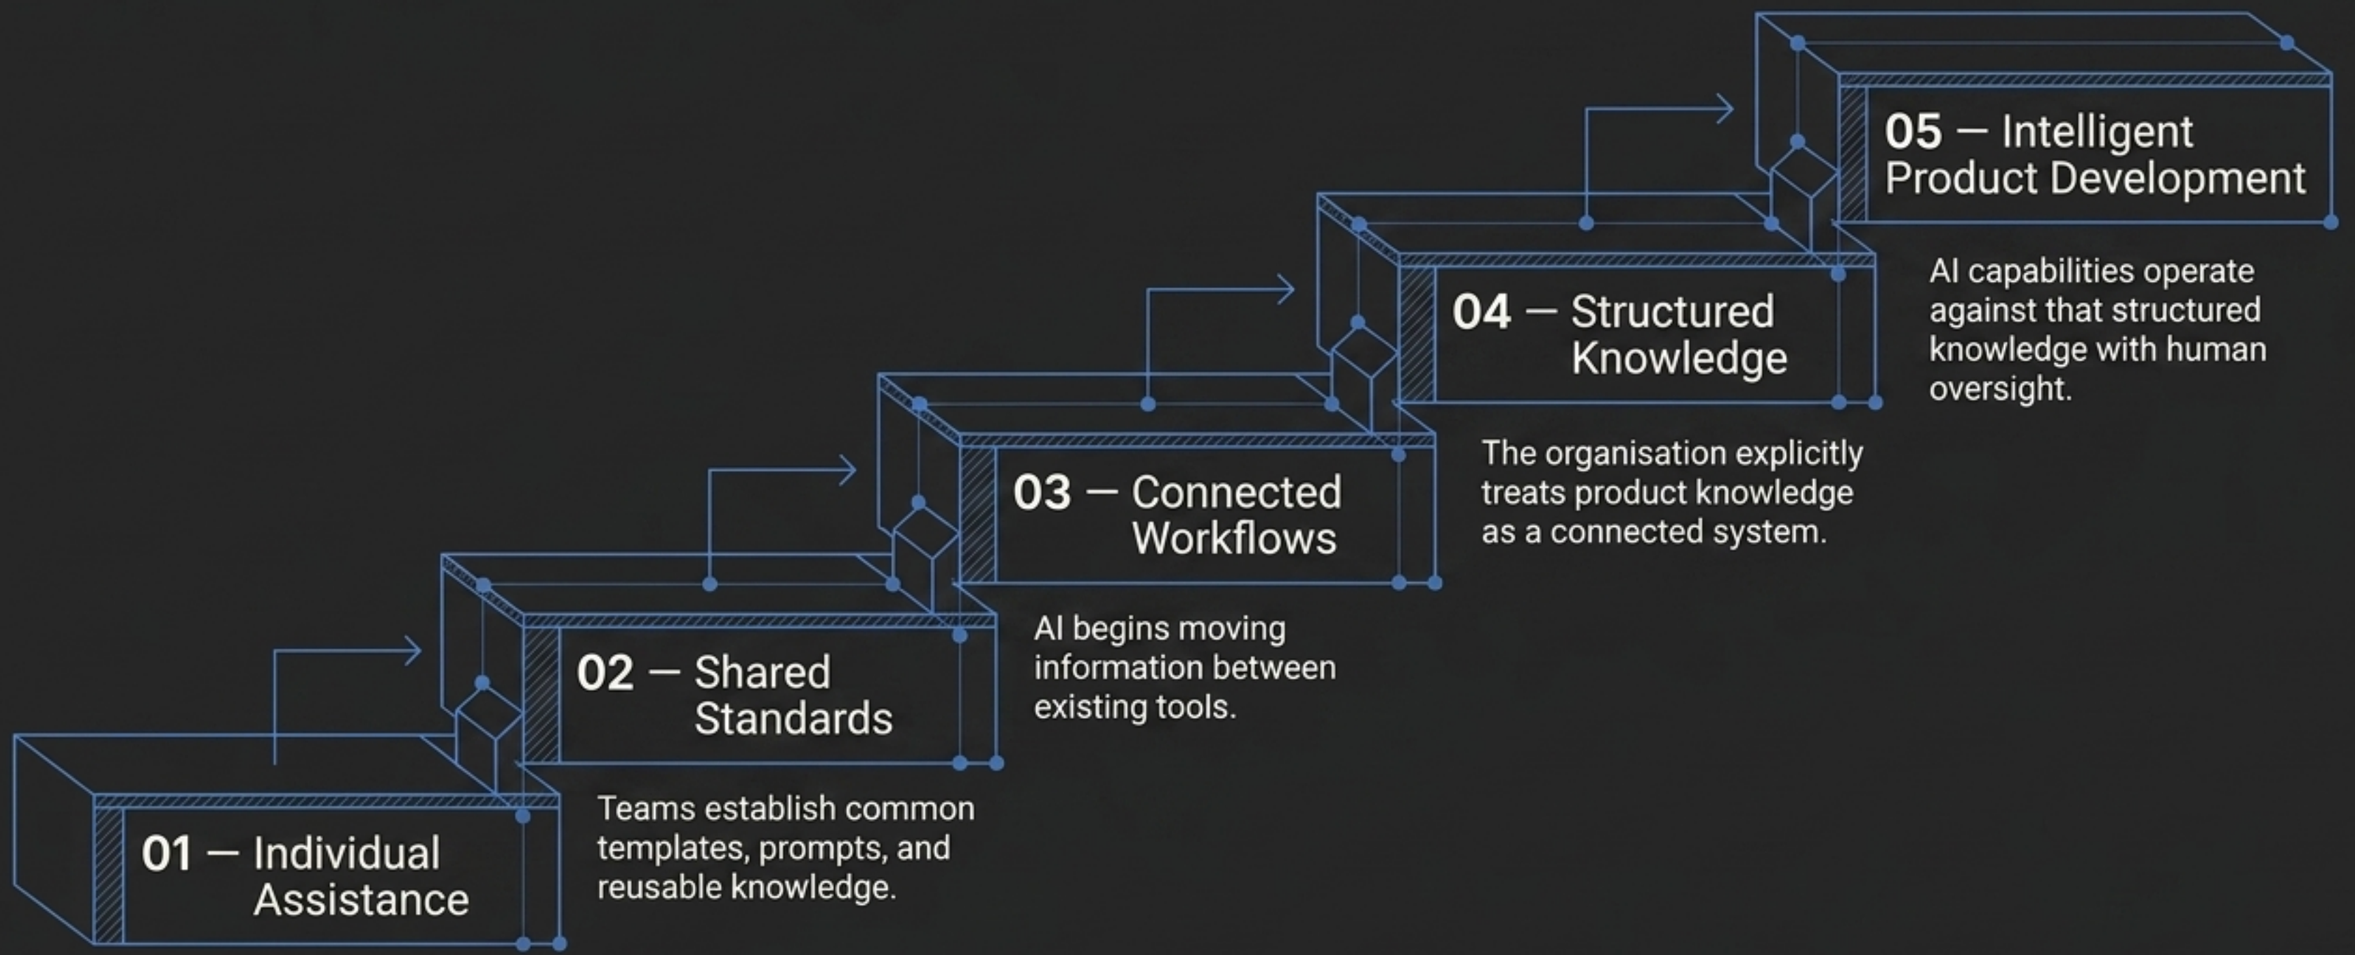

How do changes propagate safely without cascading errors?

This conceptual architecture has not yet been implemented as a production system. The next logical step is a controlled proof of concept, not a complete overhaul.

Gemini Notebook

STATUS: EXPLORATORY / CONCEPTUAL

A Pragmatic Path to Adoption

Organisations do not need to jump directly to autonomous agents. Evolution is incremental.

Gemini Notebook

The Emerging Opportunity

STATUS: CONCEPTUAL / OPEN FOR EXPERIMENTATION

The opportunity is not simply to make designers faster. It is to explore whether the **knowledge behind product development** can become a more **durable, connected,** and **intelligent system**.

AI may change not only how organisations work, but how their workflows are fundamentally designed around intelligence.
